The Green Cause Website Development Setup

1. Credentials
2. Recommended Tools
3. Website Overview
4. Frontend
   - WordPress
   - Vercel
5. Backend
   - VPS
   - Workflow
6. Recommended Changes

Necessary Credentials:

Namecheap:

Username: fridaruiz238
Password: risKyOv3rt1me0

Interserver VPS:

Username: thegreencauseinitiative@gmail.com
Password: 3nvironmentaL101!

VPS root login:

Username: root
Password: C3=Lu6-N0

DB (mySQL):

DB_PORT=3306
DB_HOST=173.225.103.252
DB_USER=thegreencause
DB_PWD=3nvironmentaL101!
DB_NAME=lessons

Recommended Tools:

DBeaver:

Really good DB tool. Data can be seen and easily edited with or without mySQL code.
https://dbeaver.io

Postman

Easy & beautiful API platform.
https://www.postman.com

Website Overview!

Here's a general introduction to the website setup. The website is split up into two parts: Wordpress and NextJS (TS). The Wordpress section is pretty simple, there isn't much to it. The NextJS section has quite a bit of things going on. Its frontend is hosted on Vercel while the backend is hosted on Interserver. The frontend serves the available lessons and sends form data to the backend. The backend (Golang) sends all the lesson data and sends the file once requested. It also stores the form-data in the DB.

Frontend

WordPress:

To access:

Visit Namecheap and login with the provided credentials. Once logged in, there should be a button that says domain list. Click it, and then select the domain and open its CPanel. The CPanel site should have a Wordpress button. (Contact me if not, I currently don't have access to it)

The site has a variety of plugins and it gets the job done. I'm not sure about what exactly there is to the site as I wasn't the one who made it, however there's not much to it. It's just a simple Wordpress site. I personally recommend re-developing it in NextJS (more info about that further down)

Possible Issues:
There may or may not be issues with the contact page. Some of my changes may have been changed again, so there's two contact forms on the contact page. There's also an odd testimonial on the testimonial page.

Vercel:

To access:

Login to Vercel and access the team workspace. You can see how the deployments go through here.

Not much to say about the individual Vercel deployment, the deployments are automated.

There are two frontends:

- The lessons frontend

- The “The Green Cause” frontend
-

The “The Green Cause” frontend was meant to be a remake of the Wordpress website, however there were some UI/UX decisions to be made that slowed it down. You can continue working on it if you like (or revamp the Wordpress site).

Both frontends are programmed in NextJS and Tailwind CSS but the lessons page is programmed in NextJS Typescript. The frontend code should be self-explanatory along with its built-in API routes.

Backend

VPS:

To access:

Visit Interserver and login with the provided credentials. Select VPS and click the settings button. You can view the desktop and run some changes there. (to stop the API for changes, press CTRL + C)

The Interserver currently hosts the mySQL DB and the Go backend API. The mySQL DB runs as a system process to be run in the background while the backend is simply run as a main process (go run main.go).

The mySQL DB can be manipulated through the VPS itself or a DB tool. There’s not much to say about it.

Currently, the backend workflow is a bit messy but here’s what I do: - Add/edit code to the repository, run in a Docker instance with simulated limits (a Docker instance with 2G RAM and 1 core)
- After committing updates, enter the VPS and fetch the repo
- Run the Go application.

The code is pretty self-explanatory. If you have any questions, you can contact me.

Recommended Changes:

Looking back on the code, here’s some changes I recommend.

- Securely store the API somewhere rather than directly committing in a private repo

This is pretty obvious. Although the code seems relatively safe for now (as

it’s private), it’s best to find a way that would avoid direct commits.

- Add some sort of security measure to prevent unauthorized requests to the Go API.
- Freshen up the UI for the lessons page.
- Rebuild the Wordpress website in NextJS

    This is probably the largest task. I recommend you get some design confirmations from Frida and the design-related teams. It’s not very difficult, but there obviously are some systems which will take time. (Ex: the contact page and chapters page)

That’s about all that’s needed to get started. I wish you the best of luck in your journey with The Green Cause.
